Spreadsheets

Advantages	Disadvantages
Easy to set up	Cumbersome
Do not require much training	Separate data don't "speak" to each other
Easy to read	Difficult to track data over time
	Reporting can be hard

At some point, you *will* max out on spreadsheets

Databases are different

They store data differently

- Spreadsheets store data in cells inside a grid of rows and columns while *databases store data in records that come from external tables*

They are structured differently

- Spreadsheets are static (although they can have formulas) while *databases are relational and can be more flexible*

They have different uses

- Spreadsheets are for smaller datasets, calculations, and visual data while *databases are better for complex data, data integrity, and collaboration.*

Constituent Relationship Manager (CRM)

Constituent

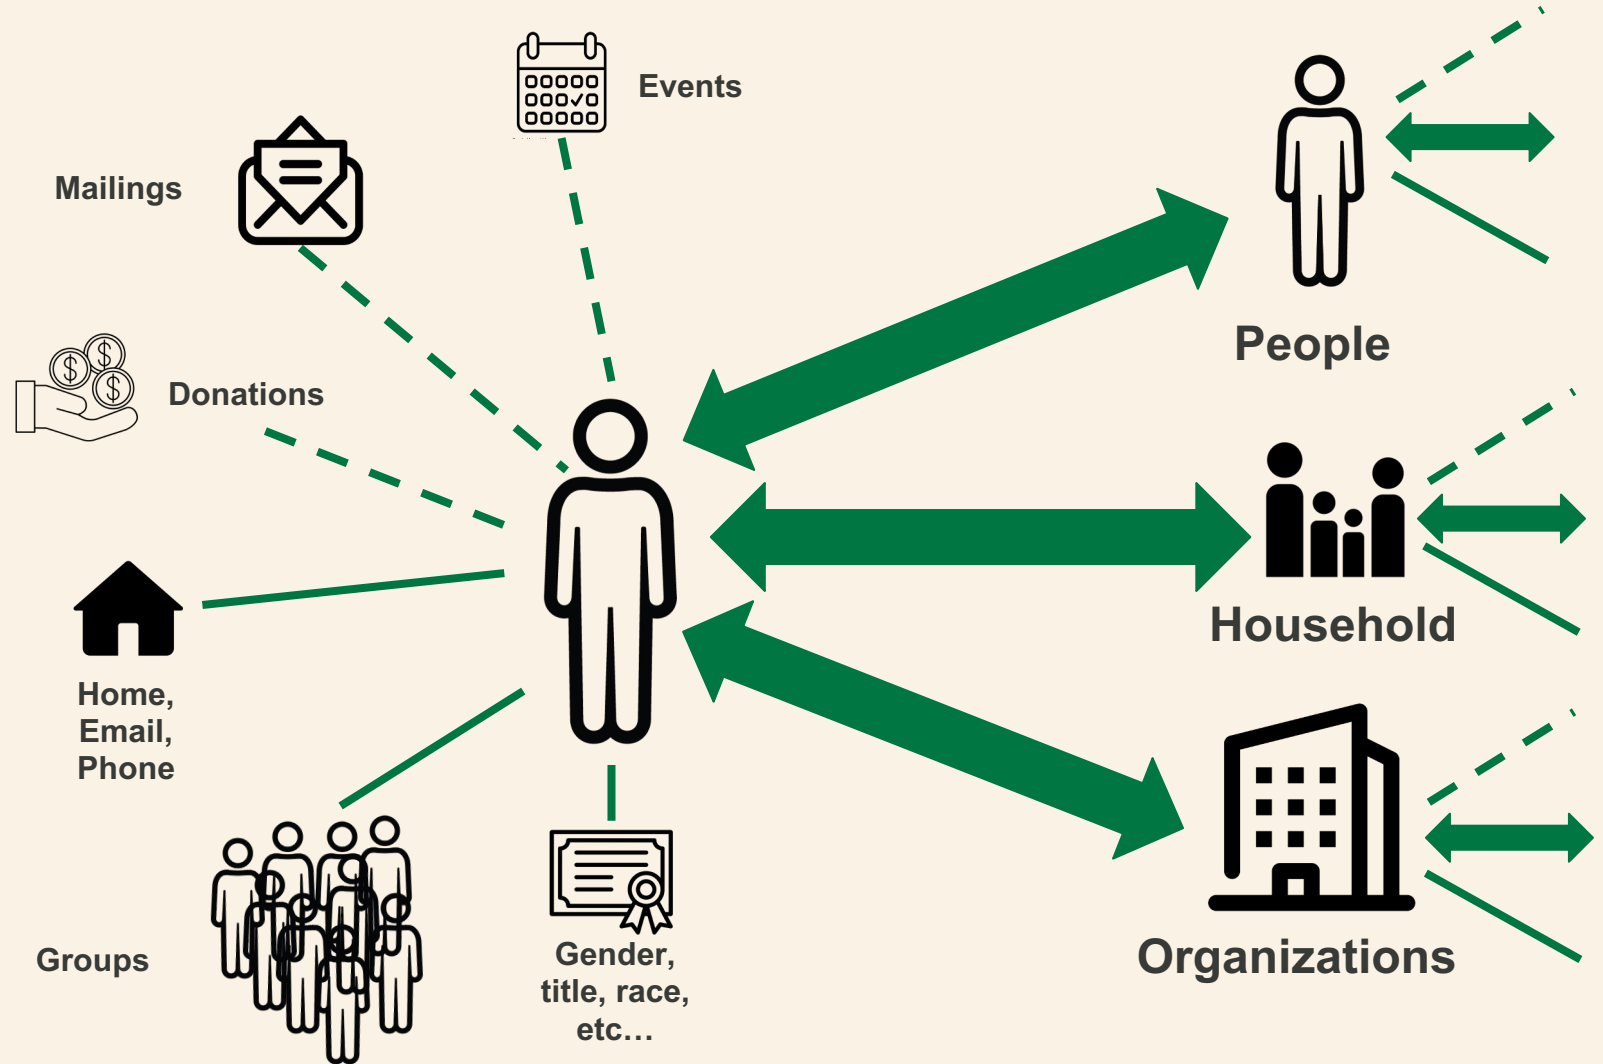

What is a CRM?

Types of Connections

Activities:
things people "do",
static

Characteristics
info, traits, groups

Relational:
dynamic and
changing

Where and what is a tree?

Types of Connections

Activities:
things people “do”
static

Characteristics
info, traits, groups

Relational:
dynamic and
changing

First go: As an activity

- Someone receives or plants a tree: something they “did”
- Simple and easy
- Captures the way we think about trees and engagement
- *However...*
 - The tree is always connected to a person and moves with the person
 - The tree can not have its own relationships or activities

Where and what is a tree?

Types of Connections

Activities:
things people “do”
static

Characteristics
info, traits, groups

Relational:
dynamic and
changing

Second Go: As a Relationship

- A tree is a “person”
 - Has activities, relationships, traits
- Can have multiple relationships
- Dynamic and changing

Trees Are People Too

People

Own address
Own actions
Own characteristics
Relationships (spouses, children, work)

Trees

Own address (lat/long)
Own actions (watering, pruning)
Own characteristics (Species, age)
Relationships (nursery, planter, adopter)
Types (giveaway, private, public)

Practical Implications

Making trees as people allows for:

- Easier tracking
- Robust searching and reporting
- Multiple characteristics and activities that belong to the tree
- Explicit and nuanced connections across data sets

Also Shifts Our Thinking

Trees as Objects

They exist out there,
isolated and separate from us

Trees as Relationships

They are networked and
connected within an ecosystem

Which brings us back to

Fractals (n.)

A shape, often mathematically defined, in which each part has the same statistical character as the whole.

Similar relationships and patterns recur across scales.

Trees Are Fractals on Many Scales

And so are our relationships

Just like a branching tree's shape,
our relationships to trees, nature, and each other are fractals.

These relationships repeat across scales of time, space, and scale:

- with ourselves
- with each other
- with our community
- with the universe

Takeaway

Data structure matters
